Experimental-toxicologic studies permit the conclusion
that dust of alloys containing manganese (ferromanga-
nese and silicomanganese) exert a toxic effect on the
organism. The toxicity of ferromanganese dust is
higher than that of silicomanganese. (Author)

A study of the working conditions in plants producing
and using ferroalloys demonstrated that in these plants
aerosols of ferrosilicon are released. The dust particles
were less than 4 μ in size. Experimental studies
on the comparative toxicity of dusts of ferrosilicon and
ferric oxide after intratracheal administration demon-
strated that a considerable difference exists in the
